

Generator Fire Safety

Run Generators No Less Than 20ft from any Building

Always keep your generator at least 20 feet from any door, window, vent or flammable materials like those in a deck, shed or garage.

Never Refuel a Hot Generator

Always turn your generator off and allow to cool before refueling. Refueling a hot generator risks igniting any spilled fuel.

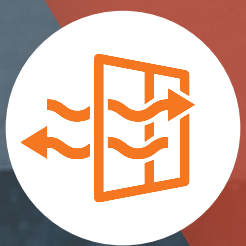

Use a Proper Wet Weather Running Cover

Use a generator tent like GenTent® with NFPA fire retardant materials to avoid weather related fire & electrical risks.

Check your Cords and Wires

Only use heavy-duty outdoor rated three-prong extension cords. Always check for cuts and tears.

Consider Your Exhaust

Point your generator exhaust away from vents, windows and anything flammable.
